

ABSTRACT

A plastic bag 10D with a zipper 5 on an inner surface of an upper opening portion 14 of a bag body composed of plastic films 11 and 12, the zipper having a groove 7 and a protrusion 8 being engaging with and disengaging from each other. Both sides 13 and a bottom side 15 of the bag 10D are fused, and cut-offs 35 are made at both sides in the upper portion 14. With the zipper 5, the upper portion 14 can be opened and closed, and the upper portion 14 can be wide open. Further, at least one heat fusible plastic sheet may be put between the films 11 and 12, so that a plural number of chambers can be formed. Also, the films 11 and 12 may be fused along a vertical line, so that a plural number of chambers can be formed.
